

## ADDITIONAL FILE 1

**Table S1.** Taxonomic Distribution of Organisms Possessing AHL Lactonase and AHL Acylase with Respect to the Amino Acid Sequences of the Enzyme Present in the Reference Organisms: *Bacillus* sp. SB4 (GenBank [AAR85482.1](#)), *Ralstonia* sp. XJ12B (GenBank [AAO41113.1](#))

AHL-Lactonase	AHL-Acylase
Reference Organism	
<i>Bacillus</i> sp. SB4 (GenBank <a href="#">AAR85482.1</a> )	<i>Ralstonia</i> sp. XJ12B (GenBank <a href="#">AAO41113.1</a> )
Actinobacteria	
<i>Arthrobacter chlorophenolicus</i> A6	<i>Actinoplanes utahensis</i>
<i>Frankia</i> sp. EAN1pec	<i>Arthrobacter viscosus</i>
<i>Mycobacterium</i> sp. MCS	<i>Nocardioides</i> sp. JS614
<i>Mycobacterium smegmatis</i> str. MC2 155	<i>Streptomyces</i> sp. FERM BP-5809
<i>M. marinum</i> M	<i>Streptomyces</i> sp. M664
<i>Streptomyces clavuligerus</i> ATCC 27064	<i>Streptomyces</i> sp. Mg1
<i>Rubrobacter xylanophilus</i> DSM 9941	<i>S. ambofaciens</i> ATCC 23877
<i>Rhodococcus</i> sp. RHA1	<i>S. griseus</i> subsp. <i>griseus</i> NBRC 13350
	<i>S. lavendulae</i> subsp. <i>lavendulae</i>
	<i>S. mobaraensis</i>
	<i>S. sviceus</i> ATCC 29083
	<i>Symbiobacterium thermophilum</i> IAM 14863
Acidobacteria	
<i>Candidatus Koribacter versatilis</i> Ellin345	<i>Solibacter usitatus</i> Ellin6076
<i>Uncultured Acidobacteria bacterium</i>	
Cyanobacteria	
	<i>Cyanothece</i> sp. ATCC 51142
	<i>Cyanothece</i> sp. CCY0110
	<i>Cyanothece</i> sp. PCC 7424
	<i>Cyanothece</i> sp. PCC 7822
	<i>Cyanothece</i> sp. PCC 8801
	<i>Cyanothece</i> sp. PCC 8802
	<i>Gloeobacter violaceus</i> PCC 7421
	<i>Microcoleus chthonoplastes</i> PCC 7420
	<i>Nostoc punctiforme</i> PCC 73102
	<i>Synechocystis</i> sp. PCC 6803
Bacteroidetes	
<i>Cellulophaga</i> sp. MED134	<i>Algoriphagus</i> sp. PR1
<i>Croceibacter atlanticus</i> HTCC2559	<i>Microscilla marina</i> ATCC 23134
<i>Flavobacteria</i>	<i>Pedobacter</i> sp. BAL39
	<i>Polaribacter irgensii</i> 23-P
	<i>Robiginitalea biformata</i> HTCC2501
	<i>Salinibacter ruber</i> DSM 13855

#### ADDITIONAL FILE 4

#### SIGNATURE ANALYSIS – FREQUENCY AND DISTRIBUTION PATTERN

**AHL-lactonase and -acylase specific signature:** The sequences of 4 to 30 data sets submitted groupwise to MEME program (<http://meme.nbcr.net/meme/meme.html>) revealed ten signatures (25-30 nucleotides, nts in length) for each species. Regular expression diagram of signatures (nucleotides) (Additional files) and the frequency of occurrence of motifs obtained through MEME for different taxonomic groups (Additional files) have been presented with reference to:

**i) AHL-lactonase gene (*aiiA*) of *Bacillus* sp. SB4 GenBank AAR85482.1 (Additional files 2-3):**

a) Actinobacteria: Data (Figure S1 and Table S2) reveal that seven out of 10 signatures designated as M1, M3 to M6, M9 and M10 were observed to be present at high frequency among actinobacterial members. These can be considered as unique as they were absent from all other taxonomic groups. Incidentally, the order of occurrence of these signatures within the gene *aiiA* didn't follow any unique pattern.

b) Firmicutes: Data (Figure S2 and Table S3) reveal two signatures – M1 and M10 among Firmicutes to occur with highest frequencies of 25/30 and 21/30. These signatures can be considered as unique on the basis of their absence from all other taxonomic groups. The order of distribution of all the 10 signatures was almost similar (M5)-M4-M7-M1-M2-M3-M10-M4-M8-M9-M5 in the cases of *Bacillus* sp. SB4, *Bacillus* sp. 91, *Bacillus* sp. A24, *B. cereus*, *B. subtilis* strain BS1 and *B. thuringiensis* strain BCR-ZYR25. Two other *B. thuringiensis* str. Al Hakam and *B. thuringiensis* serovar israelensis ATCC 35646 have only 4/10 signatures ordered as M9-M4-M1-M2. Another distinct group possessing primarily two signatures oriented as M10-M1 was constituted of *Bacillus anthracis* str. Ames, *Bacillus weihenstephanensis* KBAB4, *Clostridium botteae* ATCC BAA-613, *Clostridium kluyveri* DSM 555, *Geobacillus* sp. WCH70 *M. thermoacetica* ATCC 39073. Signatures in similar orientation: M9-M3-M4-M7-M10-M6-M1-M8-M2-M5 were observed in all the strains of *S. aureus*: RF122, MW2, MSSA476 and Mu50.

c) \_Proteobacteria: Data (Figure S3 and Table S4) reveals that five signatures – M1, M3, M4, M6 and M7 in genes (*aiiA*) from organisms belonging to \_Proteobacteria occurred with a high frequency of 19/22 to 22/22. These signatures can be considered as unique on the basis of their absence from all other taxonomic groups. A screening of the regular expression diagram (Additional file 6) however, didn't reveal any pattern of occurrence of the signatures within the gene to be unique to any genera. *A. tumefaciens* and *Sagittula stellata* E-37 showed repetitiveness for M3 and M4, and *Jannaschia* sp. CCS1 had many signatures in duplicate – M1, M3, M7 and M10.

d)  $\gamma$ -Proteobacteria: Data (Figure S4 and Table S5) reveals that all the 10 signatures were present in *Burkholderia* spp. and *Ralstonia* spp. Except the signatures – M2, M8 and M10, all other signatures were present exclusively among these 5 organisms of  $\gamma$ -Proteobacterial group. Incidentally no correlation between the genera and the order of distribution of the signatures - M1, M3, M4, M5, M6, M7 and M9 could be established.

e)  $\gamma$ -Proteobacteria: Data (Figure S5 and Table S6) reveals that signatures M2, M3, M4 and M10 were found to occur with higher frequency of 14/16 to 15/16. All the signatures were exclusive to this  $\gamma$ -Proteobacterial group, since these were absent from all other taxonomic groups. High similarity in the order of occurrence of the signatures was observed largely within the genera such as *Acinetobacter*, *Xanthomonas* and *Xylella*.

f)  $\gamma$ -Proteobacteria: Data (Figure S6 and Table S7) reveals that all the signatures except M4 were present in all the members of this taxonomic group and were unique, since they were not observed in any other taxonomic group. The order of occurrence of these signatures was different in all the organisms of this group.

g) Euryarchaeota: Data (Figure S7 and Table S8) reveals that all the signatures except M3 and M9 were present with a high frequency among the different members of Euryarchaeota. These can be considered as unique to this group as these could not be observed among other taxonomic groups.

h) Ascomycota: Data (Figure S8 and Table S9) reveals that all the 10 signatures were present with equal frequency and were unique to this taxonomic group. The order of occurrence of these signatures within the gene for AHL-lactonase of these organisms was almost identical except *Aspergillus oryzae* RIB40, which had signatures M1 and M3 in duplicate.

## ii) AHL-acylase gene (*aaiD*) of *Ralstonia* sp. XJ12B GenBank [AAO41113.1](#) (Additional files 2-3):

a) Actinobacteria: Data (Figure S9 and Table S10) show that signatures M1 to M3, M8 and M9 were present with a high frequency of 9/9. All signatures except M1 can be considered as unique to Actinobacteria on the basis of their absence from all other taxonomic groups where as M1 was also present in organisms belonging to  $\gamma$ -Proteobacteria and  $\beta$ -Proteobacteria. Visual observation of Figure (Additional file 18) reveals that there is a lot of variation in the order of occurrence of the 10 signatures. However, it can be recorded that all the signatures showed multiplicity of occurrence in the range of 2 to 4.

b) Bacteroidetes: Data (Figure S10 and Table S11) revealed that signatures – M3, M7 and M8 were present in all the organisms under consideration. Duplication of signatures was observed in 5 out of 7 organisms. No characteristic order of occurrence of signatures or their location at a give position within the gene sequence was evident. However, all the signatures can be considered as unique except M1, which was found to occur among cyanobacterial members as well.

c) Cyanobacteria: Data (Figure S11 and Table S12) revealed that signatures – M2 to M7 were present in all the organisms under consideration with a frequency of 9/9. Duplication of signatures was observed in 7 out of 9 organisms. Characteristic order of occurrence of signatures or their location at a give position within the gene sequence was evident among *Cyanothece* spp. as M4-M7-M2-(M10)-M5-M8-M1-M6-M3-M9-M10. On the other hand, similarities in order of signatures were also evident among *Nostoc*, *Microcoleus* and some *Cyanothece* strains as M6-M5-M2-M7-(M4)-M3-(M1)-M4. However, signatures can be considered as unique as these were found to occur exclusively among cyanobacteria.

d)  $\gamma$ -Proteobacteria: Data (Figure S12 and Table S13) show that signatures – M1, M7, M9 and M10 occurred with high frequency of 7/8 to 8/8. All the signatures were found to be present only with the members of  $\gamma$ -Proteobacteria, hence may be considered as unique. There was no unique order of occurrence of signatures which could be correlated to any genera or species. All the signatures were present as repeats in at least one of the organisms and each organism had at least one of the signatures as duplicated.

e)  $\gamma$ -Proteobacteria: Data (Figure S13 and Table S14) show that almost all the signatures were present at high frequency of 6/8 to 7/8. Due their absence from other taxonomic groups, we may consider them as unique to  $\gamma$ -Proteobacterial members. Out of the 10 signatures, at least one of them was found to be present as multiple repeats and each of the organisms had at least one of the signatures in repeat form. We could not draw any co-relation between the order of occurrence of the signatures and the organisms possessing them, primarily because of their high repetition with the gene.

f)  $\gamma$ -Proteobacteria: As this group of organisms was quite large we have presented the organisms in three categories (to suit to the criteria of MEME procedures - See Methods for justifications): i) *Pseudomonas* spp. (Figure S14 and Table S15) show, ii) *Shewanella* spp. (Additional files 30,31) show and iii) others members of  $\gamma$ -Proteobacterial group (Figure S15 and Table S16).

i) For *Pseudomonas* spp. (Figure S14 and Table S15) signatures M1 to M10 occurred with a high frequency of 19/21 to 20/21. Except signature M4, none of the signatures were found in any other member of  $\gamma$ -Proteobacteria or any other taxonomical group, which may thus be called as unique to *Pseudomonas* spp. Signatures M1 and M8 were found to be absent only from the two strains of *Pseudomonas putida* - F1 and GB-1.

ii) For *Shewanella* spp. (Figure S15 and Table S16), signatures M1 to M10 occurred with a high frequency of 11/12 to 12/12. *Shewanella woodyi* ATCC 51908 was the only organism which lacked signatures M4, M5, M8 and M9. The signatures observed here were absent among all other members of  $\gamma$ -Proteobacteria or any other taxonomical group, which may thus be called as unique to *Shewanella* spp. No clear cut co-relation could be drawn between the order of occurrence of the signatures and the organisms possessing them.

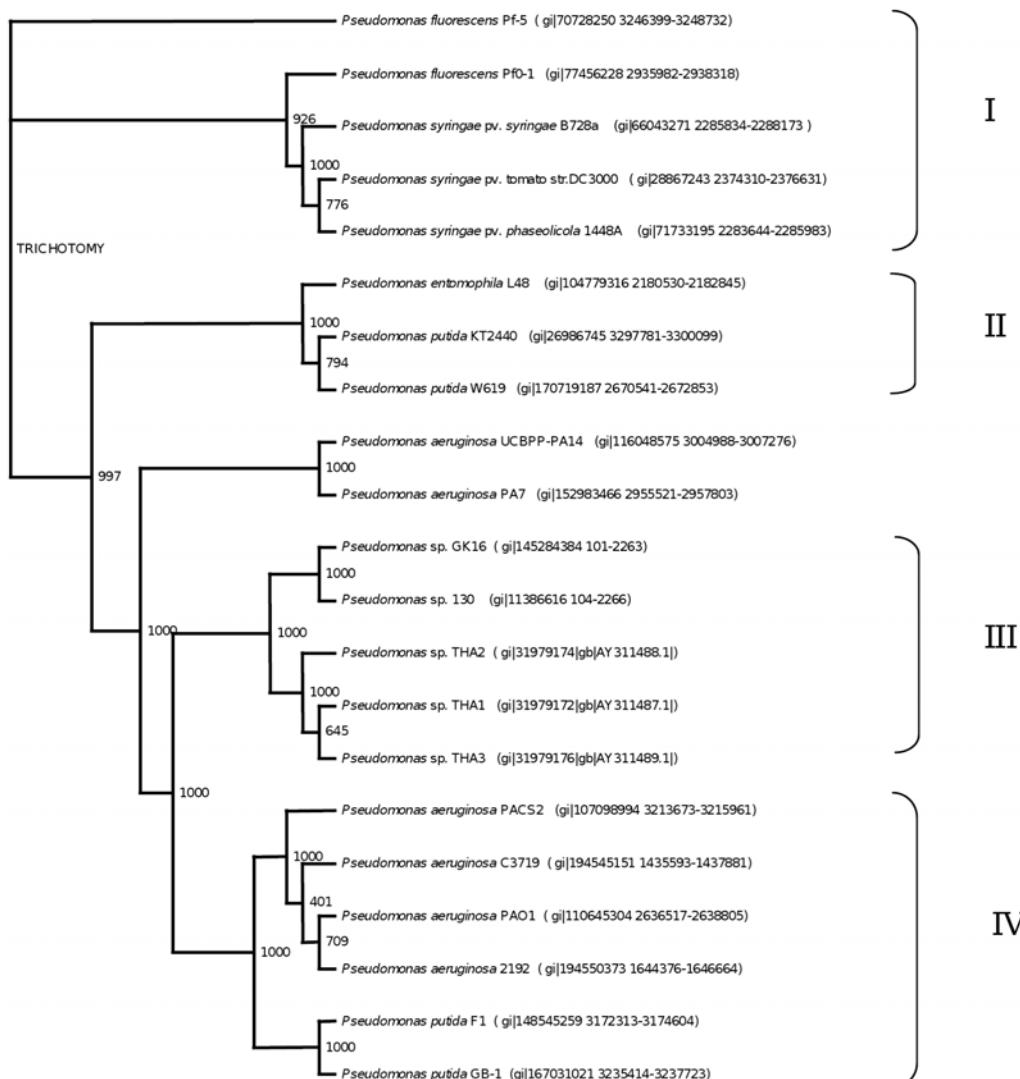

iii) For *\_*-Proteobacterial members other than *Pseudomonas* spp. and *Shewanella* spp. The information on the occurrence of signature (Figure S16 and Table S17) shows that the overall frequency of signatures was low which may be because of high diversity of organisms in this “category”. Signatures M3 and M8 occurred with a relatively high frequency of 12/16 to 14/16. Signatures M1, M6, M7, M9 and M10 were found to be present only among the organisms under consideration. We could not draw any clear cut co-relation between the order of occurrence of the signatures and the organisms possessing them. *Alteromonas macleodii* 'Deep ecotype' was unique as it possessed only three signatures – M8, M9 and M10.
